**FOKUS
ZUKUNFT**

Hubei Hongshan IFM (conversion of logged to protected forest) Project

Forest protection in China for more biodiversity

The project is being implemented in Hongshan County, Suizhou City, Hubei Province, China, by Zhejiang Zhongzheng Forestry Development Co, Ltd.

The areas are mixed deciduous forests, partly combined with mixed coniferous forest, with tree species such as oak and Masson pine.

All sub-areas had legal logging rights issued by the local forestry office prior to the implementation of the project activity. Prior to 2015, these were all forests where trees could be felled and sold after reaching rotation age based on a timber harvesting plan. Through the implementation of the project activity,

the trees will be converted into protected forests to reduce GHG emissions by approximately 8,796,424 tCO₂e over 30 years.

Overview of the project data:

Hubei Hongshan IFM (conversion of logged to protected forest) Project

The project contributes to the following sustainability goals:

Climate action:

The operation of the project activity saves approx. 228,707 t CO₂e.

Life on land:

The project contributes to biodiversity by providing a secure habitat for wildlife.
